

.NET Developer Assessment

The **purpose of the assessment** is to assess the technical skills of applicants applying for the job as .NET developer. The solution consists of two projects.

The GeneralKnowledge.Test project contains a number of tests to get a better understanding of the experience level of the applicant and covers various areas including string manipulation, XML processing and image conversion.

The WebExperience.Test project is a MVC web application, in which the applicant is expected to achieve the objectives below:

- Create an API controller to perform all CRUD operations on the asset objects created as part of the CSV processing test
- Visualize the assets in a paged overview showing for each asset the title and the created on field
- Clicking one asset should navigate the user to a detail page showing all properties
- Any data repository is permitted (for example Entity Framework)
- Use a client MVVM framework, for example Angular or Knockout

Please create a private repository on BitBucket to host your code and give access to us by sending the zip files containing the repo to ev@stylelabs.com.
